Recommendations for Fully Vaccinated People

Wear a mask in public indoor settings if in an area of [substantial or high transmission](#)

Choose to **mask regardless of the level of transmission**, especially if you or someone in your household is immunocompromised or at [increased risk for severe disease](#), or if someone in your household is unvaccinated

Test 3-5 days after a known exposure to someone with COVID-19

AND

wear a mask in public indoor settings for 14 days or until you receive a negative test result

Why Follow These Recommendations

Delta Variant

The Delta variant is 200% more transmissible, meaning it can easily spread to more people. Research suggests fully vaccinated people infected with the Delta variant can spread it to others.

Yourself

No vaccine is 100% effective. There is still a chance you could get COVID-19 after vaccination.

Helps Protect Others

Helps protect children, others that can't be vaccinated, and those with certain medical conditions.

People who are at increased risk for severe disease include older adults and those who have certain medical conditions, such as diabetes, overweight or obesity, and heart conditions.
